

Backend Schema Design

Some Important Notes :

- “restTimeForRelocation” is the minimum tie gap needed for a driver to rest (and/or reallocate in case of different last route end location and next route start location).
 - While the current implementation doesn’t try to minimise it, it would be great avenue to focus on to increase efficiency and productivity.
- We have added some dummy fields like “dob”, “contact” that have no functional use; just to feature the scalability of the overall system.
